Case Study # 25
Alzheimer’s Disease

Jillian O’Neil
Lisa Silvaggio
Dementia

A condition that involve loss of memory and impaired cognition

This condition may include: impairment in language, object recognition, motor skills, abstract thought, and judgement to an extent that interferes with daily life.
Alzheimer’s Disease

“the most common form of dementia, characterized by formation of amyloid plaques in the brain and neurofibrillary tangles within neurons” (Nelms 610)
Alzheimer’s Disease

**amyloid plaques** - cellular deposits found between nerve cells

**neurofibrillary tangles** - collections of twisted tau (a protein) found in the cell bodies of neurons
“Apolipoprotein E” (APOE), a gene variant, is the risk factor for AD in those aged 65 years and older

- produced in liver
- circulated with the VLDLs in blood
- found in 40% of patients with AD
- only found in 15% of general population
- those with variant: 3-4x increased risk of developing AD
- presence of presenelin 1 (PSEN1), presenelin 2 (PSEN2), and amyloid precursor protein (APP) are linked to early-onset of AD
Etiology, continued

Possible links with development of AD:
CVD, Diabetes, free radical oxidative damage, Down syndrome & previous head injury

Decreased risk of developing AD:
increased intake of fruits, vegetables, fish and omega-3 fish oils
Diagnostic Measures

 DSM-IV-TR Diagnostic Criteria for Dementia of the Alzheimer’s type:

1. memory impairment
and at least one of:
2. aphasia, apraxia, agnosia, and/or disturbance of executive functioning
Patient Description-Mr. McCormick

- 89 y.o. male
- BMI of 19.3 kg/m^2
- Lost about 30 lbs in 4 yrs
  - % UBW of 81.2%
- MI at ages 45 and 62
- HTN for 44 yrs
- Veteran’s Long-Term Care Facility for past 3 yrs
- Family hx of heart disease and AD
- Frail and thin appearance, agitated and confused

Patient Diagnosis

- Diagnosed with AD 4 yrs ago
- Stage III full thickness nonpressure wound
  - Fell and hit hip on the corner of a bed
Wound Healing

After cellular injury, the body’s natural response involves the process of wound healing

“Healing is the repair and restoration of damaged tissue and cells, and is the process by which structure and function are restored after injury” (Nelms 167)
## Laboratory Measures related to infection and wound

<table>
<thead>

Wound Healing Stages

1. Inflammation
   a. time of injury to 4-6 post injury
   b. bleeding controlled by coagulation, clot formation
   c. vasodilation and increased capillary permeability
   d. neutrophils phagocytize bacteria
   e. macrophages remove debris and necrotic tissue; secretes growth factors
Wound Healing Stages

2. Proliferative
   a. end of inflammatory stage to next 2-3 weeks
   b. epithelial cells form protective covering
   c. Angiogenesis allows development of granulation tissue
   d. fibroblasts produce collagen and matrix protein
   e. cross-linking occurs to strengthen wound
   f. myofibroblasts induce wound contraction
3. Remodeling
   a. end of proliferative to up to two years
   b. collagen matures and stabilizes
   c. fibrous scar tissue matures
   d. decrease in fibroblasts and vascularization

Important to know: the skin will never retain it’s full strength when this stage is completed
## Essential Nutrients for Wound Healing

### Table 11

**Essential micronutrients for wound healing**

<table>

<td><strong>Vitamins</strong></td>
<td></td>
</tr>
<tr>
<td>Vitamin A</td>
<td>Stimulant for onset of wound healing process&lt;br&gt;Stimulant of epithelialization and fibroblast deposition of collagen</td>
</tr>
<tr>
<td>Vitamin C</td>
<td>Necessary for collagen synthesis</td>
</tr>
<tr>
<td><strong>Minerals</strong></td>
<td></td>
</tr>
<tr>
<td>Zinc</td>
<td>Cofactor for collagen and other wound protein synthesis</td>
</tr>
<tr>
<td>Copper</td>
<td>Cofactor for connective tissue production&lt;br&gt;Collagen cross-linking</td>
</tr>
<tr>
<td>Manganese</td>
<td>Collagen and ground substance synthesis</td>
</tr>
</tbody>
</table>
Nutrition Requirements

- **Energy-**Using Mifflin-St Jeor
  - 1300-1400 kcal/day

- **Protein**
  - Factor of 1.5 g/kg/day = 93 g/day of protein
    - Wound healing, malnutrition, elderly

- **Micronutrients for wound healing**
Dosage Recommendations, Additional Supplementation

- 20 mg of Zinc
- 2 mg of Vitamin C
- 18.5 g of Arginine
A. Unintended Weight Loss

- Unintended weight loss (NC-3.2) related to lack of appetite and Alzheimer’s disease related symptoms as evidence by weight history (30 pound weight loss), medical record (current weight of 138 pounds) and son’s statement (normal weight of 170 pounds).
Goal: Unintended Weight Loss-MNT

• gain ~0.5 lb/week
  ○ up to around 170 lbs (BMI higher than 22)
• additional 250 kcal/day
• daily caloric intake: 1550-1650 kcal/day

encouraging: high-calorie/high-protein shakes between nutrient dense meals
B. Self-Monitoring deficit

· Self-monitoring deficit (NB-1.4) related to Alzheimer’s disease symptoms of dementia as evidence by requirement of special modifications to diet, assistance with all meals and lack of independence with activities of daily living at long-term facility.
Goal: Self-Monitoring Deficit-MNT

- Consistent Nursing Aids for meal time
- Improved chance of recognizing and trusting medical staff
- Mealtime is consistent for each day to develop a routine and encourage eating
  - Minimize confusion
Treatment

- 1.5 g ampicillin-sulbactam IV every 6 hours
  - Antibiotic
- Wound debridement
  - Removal of dead, damaged or infected tissue
Pivot 1.5 Cal

- 1500 kcal/1000 mL
- 93.8 g/1000 mL protein
- 50.8 g/1000 mL fat
- Arginine and glutamine and high levels of Vitamins A, C, K, selenium and zinc
Prognosis

When the neurons die and are unable to communicate with each other, the brain will shrink. Patients with that happening have progressed to a severe stage of AD and will not be able to speak or move.
Monitoring and Evaluation

- Monitor caloric intake to see if he is meeting needs
- Check weight for any changes every week
- Continue to clean and redress wound until fully healed
  - Monitor for signs of infection
Enteral Nutrition?

● **Pros**
  ○ Has difficulty eating and getting required nutrients
  ○ Progression of disease could make swallowing more difficult
  ○ Could be used in addition to oral intake

● **Cons**
  ○ Cost
  ○ Combative episode—may be uncooperative with tubes being attached

● **Ethical?**
